

A box plot comparing the distribution of 'Delay in Months' for two groups. The x-axis is labeled 'Delay in Months' and has major tick marks at 0, 20, and 40. A vertical dashed line is positioned at x=0. The top box, representing the first group, has a median around 12, an IQR from approximately 5 to 18, and whiskers extending from 0 to 35. The bottom box, representing the second group, has a median around 10, an IQR from approximately 3 to 32, and whiskers extending from 0 to 55. Individual data points are overlaid on the box plots, showing a wider spread for the bottom group, particularly at higher delay values.
